Survivorship bias, on purpose

Everything about trader P&L here is measured in the tokens that survived. Even there, most positions are small and the big profits sit with a few wallets. Trades in the other 99.998% of tokens were not measured; most of those tokens are worth close to nothing.

What the X post got right

24.4M launches is correct. "312 above $100k" was low: we count 390 (and ~440 including early tokens without the "pump" suffix). PEPE and WIF never launched on pump.fun.

Survivors: 390 pump-suffix mints ≥$100k with ≥$5k liquidity, liquidity ≥1.5% of mcap, ≥50 holders and lifetime volume ≥5% of mcap (October 31, 2026). Sources: Dune (dex_solana.trades from 2024-05-30; adam_tehc/pumpfun), DexScreener, GeckoTerminal, CoinGecko, DefiLlama, Helius. Full methodology in the report.
